B1

718 CAYMAN GT4 RS

VERDICT:
THE TEMPEST AND “THE TEMPEST” CREATED BY THE BIGGEST SPORTS CAR EMPIRE.

Cayman, or Boxster? Are these cars just prepared for those youngsters who want to join the Porsche club but on a shoestring? Pro… Probably yes, but not today.

Both of their ancestor is the Boxster (986). It was born in 1996, which is in the period when Porsche was revolutionizing its own design language and product lines to greet the new millennium. Obviously, those executives did have learned something from the Renaissance, they deliberately made all their cars look piggy ugly, like created a “Black Death” in the Porsche world. Unquestionably this made Porsche enthusiasts in those days bogged down in the quagmire made of sorrow.

B1

However, if you look back on that period nowadays, you genuinely would discover this idea works accidentally well. These hideous cars, no, these plagues, including the first gen Boxster, 911 (996), the first gen Cayenne and the first gen Panamera, not only made a clear boundary between classic Porsches and modern Porsches but also established an abundant and solid foundation that ensured today's prosperous Porsche empire. As cars, they literally sacrificed themselves, because today, no one would like to buy and savour them, just like you definitely do not want to see some photographs of bubonic plague sufferers are hanging next to Da Vinci's Mona Lisa.

BOXSTER (986)

911 (996) GT3 RS

CAYENNE (E1)

PANAMERA (970)

B1

Despite the first gen Boxster looks vomiting, it still performed rather good in its class because of its handling. In 2005, Cayman, which is the coupé version of Boxster, was introduced. Since then, the exterior upgrade of Cayman and Boxster was nonstop. Porsche remarked these two models as 718 Cayman/Boxster in 2016 and fitted them with some mechanical improvements and a refined style, created an undisputed benchmark of entry-level sports car. Cayman and Boxster finally are not the inferior substitutes of 911s, they became a new variety which provide a tremendous looking and a tauter and fancier Porsche mid-engine driving experience, and some versions of 718 are just as desirable as 911s. For instance, the 718 GT4, which performs impressive on both tracks and roads. But its 4-liter flat-six engine is not that masterpiece from 911 GT3s, it is just a turbo-free version of the 911 (992) Carrera's engine and you can "only" rev it up to 7800 rpm. Therefore, if…

Just forget it, Porsche clarified that there will be a room confliction between the oil tank and that GT3's engine and this kind of tedious nonsense. Yes, it presumably will be a stumbling block for Peugeot, but for Porsche, Seriously? Personally speaking, the real reason is with a same 911 GT3's power, plus the mid-engine is much superior than the rear-engine layout, 718 will smash those 911s and make them look like pedigreed imbeciles.

B1

However, after entering the 2020s, the emission regulations became insanely strict due to more and more polo bears like to catch fish by standing on a piece of floating ice and some “unusual” climate changes. As a result, it is the last chance for those traditional car manufactures to show what they could make and finish their promises and fantasies.

Porsche surely wants to gain more positions in future auto museums, it sent nearly its every model even including the Cayenne to its ultimate laser laboratory – Porsche GT Motorsport. 718 is on the list again without doubt, but perhaps this time the headquarters’ only limit is no limit plus just a bit slower than 992 GT variants, “nur ein bisschen!” So, GT division firstly built a blistering 992 GT3 and then putted GT3’s 4-liter naturally-aspirated engine straight into the 718, fixed all mechanical issues, wrapped the engine with carbon fibre meticulously like a nuclear weapon, added some kits on the body, then tuned and tested it by running some laps on Nürburgring, job done, launched the car. And their perfection, the 718 GT4 RS, scientifically, technically, presumably, is the best sports car ever made.

B1

Most Porsche can not make an appealing noise, especially those turbo Porsches which sounds like vacuum cleaners. But this car, unlike its feeble brothers, its revving noise when accelerating sounds like playing the chromatic scale quickly on Clarinet, solid but elegant. Then about its look, the aero kit on this car is unexpectedly civilized, the size of these vents and the swan-neck rear wing is quite sensible, unlike those horrendous holes and that stupendous rear wing on the 992 GT3 RS. But it does not means this car will perform civilized on the track, in fact, it can lap Nürburgring in 7:04.51, 8 seconds faster than a 991.2 GT3 and 42 seconds faster than a normal 718 Cayman S…

But nobody lives on a racetrack, or will pass a track when commuting. A real desirable sports car should performs terrific on both track and normal roads. And this is exactly the GT4 RS' trump card: its daily performance is even better. Here is a demonstration. You live in Germany, Sunday morning, lovely weather, you decide to have a picnic in a mountain park. Having prepared all the needs and go to the garage, after opening the front boot, you will discover there are not two idiotic fans fill the whole trunk like the 992 GT3 RS and it could fit all your needs.

B1

Then pick your girl or boy up, where to put her/his items? Don't worry, another rear boot is waiting for you, oh, and inside the car, an immense storage substitute the infotainment system… Praktisch. In the town, the car ensures you will be the first after greenlight because it does 0-60 mph in only 2.8 secs. Entering the Autobahn, it could do 315 km/h so that you can continually enjoy others' yielding. Later, you have arrived the best habitat for this car –

mountain roads. Switching to race mode, you will immediately feel that it becomes a very different animal, and this animal does not mean a maniacal Spanish bull, but a thoroughbred, a ridable thoroughbred. Porsche engineers made a huge effort to make it more docile and more obedient, but it did not become tame like an Audi RS, it still gives so many precise and comfortable response from brakes, steering, gear changing and suspension, you will feel like it is keeping interacting with you, keeping encouraging and acclaiming you. Plus the lightning and telepathic PDK gearbox and those sensational noise from the back especially when revving up to 9000 rpm, this car literally redefined an ultimate driving experience. Finally, hum… I promise you won't go to the picnic, you will just finish those food quickly in the car, and could not wait to start another journey on these roads.

B1

Undoubtedly, this 20 years is Porsche's Renaissance, and its GT division will be the Shakespeare, a key component of this era. Then this car, the 718 Cayman GT4 RS, it does not equip any new Porsche witchcraft, on the contrary, it only contains Porsche's essential mechanisms plus pursuance to the perfect balance of performance. It is just "The Tempest" written by the Porsche GT Motorsport, a celebration to their past of passion, a benediction to the age of combustion.

PRICE NOW (NEW+OPTIONS)

(around) $275k (USD)

If you want to hear the engine noise clearer and a more exotic body, Porsche also offers this car's convertible version called 718 Spyder RS. Dw, it costs just a bit more than this car :-)

Sorry to interrupt, but you see, a Shakespeare's "The Tempest" with tons of sources and contexts costs about 25 bucks, whereas this Porsche version, with tons of necessary options like Weissach package, ceramic brakes, magnesium rims, etc and markup, it costs more than 250 grand. It supposed to be a car that is perfect in every single aspect but… Schade.

LC500 CONVERTIBLE

B2

VERDICT:

PRESENTS THE MEANING OF LEXUS PERFECTLY, A FASCINATING ROAD-LEGAL CONCEPT CAR

Ten years ago, Toyota brought a car to us that took them over ten years and a billion dollars to build – the Lexus LFA, to show the developing ability of the world's largest motor company and built an impression for their new performance brand called Lexus F-Sport at the same moment. It is a waste of time to acclaim LFA here because that car is just the greatest Japanese car ever made with a mind-blowing price tag.

B2

Since then, people always have infinity expectation to this young division, hoping F-Sport could migrate those tremendous spirits from LFA into their other production cars. As a result, their new models including RC F, IS F and GS F could easily be summarized in a word – disappointment. Wait a second, perhaps “rubbish” is better. Anyway, in 2010s, the only reason that F-Sport exist is to emphasize the speed and gorgeousness of M cars and AMGs. And they also provide some performance packages to make Lexus elderly scooters look a bit fancier. It seems like the idiotic F badge does not mean “Fast” or “Fascinating” but means “Freaky”… So, did Toyota just wasted ten years and a billion dollars?

Nobody will give a toss, because the only thing Toyota have is wealth. Anyway, thanks god that Lexus finally gave up “being performance” this fantasy, and they decided to develop a deluxe GT car seriously.

Actually, Lexus did have launched a GT convertible called SC430 in 2001, and that car is just disastrous. Hum… How about this time?

B2

Well, their result named LC500, it also could be easily used a word to describe, that is fantastic, it looks even much better than its prototype, the LF-LC concept.

Lexus first introduced the LC500 coupé version in 2017 and just look at it… That dreamy exterior will definitely cause you speechless in an instant. Lexus merged their iconic “spindle” grille with glorious side and tailgate design language inherited form the LFA perfectly, and then add some elegant details like the beautiful eyeliner-looking LED daytime driving lights and those textured rims. People always complain that Lexus cars are overdesigned, even chaotic. But LC just exactly attains an ingenious balance, all curves and chrome embellishments are just appropriate. Honestly, it is impossible to believe Lexus could style another car looks better than this. Or is it?

Aha, if you observe the LC500 coupé earnestly, the floating roof may caught your eyes. Just to be clear, this design on this car is sublime, but floating roof will always seduce you to imagine what the car will look like without its roof.

Apparently, the designer is quite amorous so that Lexus made the convertible version without hesitation in just two years. The LC coupé looks already fantastic and the LC convertible looks… Sensational.

B2

Then the engine option. Lexus offers two options for LC coupé, a 471bhp smooth 5-liter naturally-aspirated V8 engine that makes the car accelerates like a hovercraft and a 3.5-liter hybrid V6. But for LC convertible, perhaps Lexus was too lazy to figure out how to solve the room confliction caused by the folding canvas roof mechanism and the huge battery, you can only find V8 under its bonnet. Thanks to Lexus engineers' indolence! Because that hybrid system will do nothing but just ruin this great convertible GT. A true Grand-Touring car must have 8 cylinders at least. Fact!

Folding down the roof, you could observe the best-looking interior Lexus ever made thoroughly, and countless details will remind you constantly that this car is a proper descendant of LFA. And from 2023, you could order your cozy LC with a bespoke interior, including a bunch of new leather upholstery color options. Literally a good chance to show your taste.

Finally, the party piece of LC convertible – the price. For one with a condition almost brand new, you only need to pay around 105k USD. All these dreamy designs, plus this price, just humiliate its German rivals. Many people this time even start to compare this car with an Aston Martin. But unlike the Aston Martin, because of hanging a Lexus badge, the LC convertible also contains literally the best reliability in the world. That means you could have a grand tour in this car from California to Nova Scotia, enjoying the blend of great nature and breeze without any car trouble. You could not even imagine that in an Aston.

ALPINA B5 BITURBO TOURING (G31)

8

VERDICT:

BEHOLD, THE FASTEST ESTATE IS UNEXPECTEDLY IN A GENTEEL SUIT.

Let's just get it straight, the top speed of this car, are you ready? — 202 mph (325 km/h) … Ja, the fastest estate ever is here.

Maybe you are still confusing about what is Alpina. Before 2022, Alpina is a proper independent automobile manufacture focusing on tuning a BMW into a fast and comfortable limo that could literally save time for those old businessmen (BMW acquired Alpina on 03/10/2022). It even has a longer history than M Motorsport and it is completely opposite to M: Alpina tends to give you a handcrafted BMW engine with a massive torque, a civilized coachwork and a velvety ride.

Back to the car, this B5 Touring based on a BMW M550i – a rapid limousine with a 456bhp 4.4 liters twin-turbo V8. Alpina took this car and just used its conventional ways to modify it as usual, but this time, perhaps that original bimmer is already beyond excellent, their production turns out a bit… excessive. You can get 600bhp and a staggering 590 lb-ft (800 Nm) from this 2.1 tones yacht, plus some exquisite exterior details: historical Alpina golden stripes, elegant multi-spoke rims, four robust chromed exhaust pipes… And when you get inside the car, you will immediately wrap by two toned exclusive leather upholstery. Then press the “engine start” button, two genteel mazarine blue dials will assure you: it is a gorgeous Alpina.

Hum, is it the ultimate Alpina? Well, B7 and B8 are more expensive but they equipped with the same 4395cc twin-scroll turbo V8 so that the performance is almost identical. Oh, there is also a monstrous SUV called XB7, with the same engine and an idiotic price tag, and the car itself is hopeless… So honestly: Yes, it is.

8

Imagine this: you are driving a B5 Touring on the Autobahn, carrying your whole family, comfortably cruising at 190 mph and enjoying 911s' voluntary yielding, then you drive into a town, moving without any glance… The B5 Touring genuinely is a sports car hunter in a low-profile noble suit. It is lightning, refined, it is esoteric… Yikes.

PRICE WHEN IT IS NEW
(around) €155k / $170k(USD)

Finally, about price. The personal recommendation is G31.1, the facelifted G31.2 unveiled in 2020 looks too vicious, not that suitable for Alpina. And because all G31.1s are at least 4 years old, the price is more affordable as well. You can grab one with a decent condition around €80k. However, this car is only available in those main markets with conservative car culture: UK, West Europe and Japan, so you do have to pay some extra fees to bring it to your garage, annoyingly.

ABARTH 124 SPIDER (Manual)

7

VERDICT:
THIS TIME IS LEGIT, STYLED BY ITALIAN, BUILT BY JAPANESE.

Let's just ignore what is Abarth for a while because there is a interesting story behind this car.

Back to 1980s, Nissan had a huge success in European hatchback market, and one day morning, many people might notice this piece of news when having breakfast: "Alfa Romeo is about to launch a new hatchback cooperate with Nissan." Yes, Alfa plus Nissan, what will reflect in your mind immediately is a lovely Alfa-looking little hatchback with Nissan's reliability. However, after 1983, no one would like to remember this piece of news ever.

7

Because what Alfa-Nissan came out is a small hatchback styled by Nissan and assembled in Italy… The car called Arna, a hideous looking hatchback combined with an extremely dreary Nissan engine and a hopeless Alfa dependability, literally the worst model with an Alfa badge ever and its poor sales proved this. Alfa dropped it in 4 years and only 53,047 loads of Arna-ish turds were squeezed from that factory. A catastrophic failure… 30 years later, Fiat (Fiat owns Alfa) decided to work with Japanese again, this time, they were about to build a two-seater roadster with Mazda. And because of some experience they gained 30 years ago, this time they decided to let Alfa styles the car and assemble it in Japan and give it a gorgeous and historical name – Spider (roadster in Italian).

However, Alfa did not agree, they were adamant that ALFA ONLY BELONGS TO ITALY. Thankfully, Fiat has many factories oversea so that Fiat did not “belong” to Italy anymore. Then Fiat started to find a historical Fiat roadster model name. After… Maybe a few seconds, they made the compromise directly when they saw this – Fiat 124 spider, a successful small roadster model in 70s, designed by Pininfarina.

7

“124 Spider”… This name is just as suitable as the Alfa “Spider” because they were about to style the car based on the Mazda MX-5 (Miata) -- the only model could present a great affordable roadster after 1989, and 124 Spider exactly did the same job in 70s. And the result, the design, almost every single detail is according to the original 124 and it is magnificent. But it seems that this newborn 124 could not even beat her Japanese sister because the MX-5(ND) is famously great. So, Fiat sent this 124 straight to the best Italian college for sports car–Abarth & C. S.p.A.

Founded by Carlo Abarth in 1949, just two years after the birthday of the First Ferrari road-car, Abarth is a proper pioneering racing car manufacture and tunning division. Its destiny was bonded with Fiat in 1952 and almost every single Fiat racing car and performance car was developed and produced by Abarth since then, including its most emblematic models like 595, 695 and 850 TC which all based on a tiny Fiat 500.

7

Turning a 500 into a vicious track weapon perhaps is those Abarth engineers' favorite party piece, just like a group of psycho scientists who like to inject some special scorpion venoms into those cute and harmless bunnies, creating a variety of monstrous and villainous rabbits with a gigantic mouth, spiky whiskers or even a see-through belly. Abarth also used to be a terrific specialist in rally and created some breathtaking masterpieces: the all-conquering four-time WRC winning car – Fiat 131 Abarth Rally; the Quattro killer/last RWD rallying legend – Lancia Rally 037 Gr.B and the best competitor of the Lancia Stratos HF – Fiat 124 Abarth Rally.

For Abarth, this time they do not have to built the 124 for rally, so the job just like somebody lets Lewis Hamilton to win a go-cart race. Abarth took the car, tuned the 1.4-litre four-cylinder turbo engine from 138 bhp to 168 bhp, sharpened the suspension, then fitted it with a limited-slip diff, four special designed rims, Brembo brakes and the soul component – the Record Monza exhaust system, which can generate terrific noises, makes the whole car like a chihuahua in a wolf suit.

1967 ABARTH 850 TC TRIBUTE

7

As a result, this car could make 231 km/h. Sounds not quite fast? Don't worry, you will definitely feel like 231 mph in one of these.

The Abarth 124 Spider is genuinely a brilliant car, it is nimble and agile, it is exuberant and brisk. Comparing to the MX-5, people may complain that it is too pricy, it costs 7k USD more than a top trim MX-5 and makes the Abarth looks like an irrational choice…

But in fact, seven grand for those improvements is absolutely worth. It looks better, goes faster, and more importantly, these money do add some lovely Italian showmanship to the MX-5, turn the little Japanese roadster into a proper Italian sports two-seater, make your normal Sunday self-driving tour feels like una gita a Portofino. And do not forget those pops and bangs from that spectacular exhaust system, they will make you smile like a child.

MUSTANG (S650) 5.0

6

Which car model series could represent the most powerful country in the world? Challenger? Not clever and historical enough. Those big-ass pickups? No, they are trucks, not cars. Corvette? Hum, Vette is a good answer. But combined heritage, glamour and popularity, obviously, it is the Mustang.

Some cars may caught people's eyes when unveiled, and just a few cars could make a hit, but no car could make a hit like the first gen Mustang.

VERDICT:

THE LAST MUSCULOUS AMERICAN WARRIOR DID NOT SUCCUMB! HIGHEST RESPECT TO FORD.

6

Back to the 50s, Ford decided to build an affordable compact car to aim American youths, which was the fastest growing customer group during that time. In 1964, their result was introduced – the Mustang. Ford used its mighty financial power made this pony's image literally appeared in everywhere: airports, hotels, highway boards, streets… And it was also the first cover subject that both "Times" and "Newsweek" had at the same time. Under this advertising level, plus Mustang's exuberant looking and an affordable price, the first gen Mustang is the fastest-selling car of all time. Ford sold 22,000 of it on the first day, and its production number attained a million just after 23 months!

Ford Mustang GT in "Bullitt", an all-time classic spec

And the better thing about the Mustang is that the "Mustang" does not mean a single car model, it means a huge car family. Lots of striking Mustang variants and movie stars were built, including BOSS 302, Shelby GTs, Mach 1, Steve McQueen's Mustang GT in "Bullitt", Eleanor in "Gone in 60 seconds"... Countless! Only a great car developed by a great company launched in a great country's great era could replicate this miracle, which seems… Not gonna happen again.

6

Yes, this is a compact-level car, a youngsters' car in America during that period. Nowadays? Are you expecting Toyota would offer a 7-liter V8 engine in their poor Corolla? Are you waiting for Tom Cruise saving the world in a 3-cylinder Honda Civic? What on earth has happened to American youths in these 60 years? Why… Sorry, a bit off topic, back to the car. Thankfully, Mustang did not change that much in these years unlike Detroit, it still has a coupé body, a V8, four seats and a reasonable price. But Mustang's status has upgraded to "muscle car", probably because the only alive muscle car name is the Dodge Charger which is now using on a moronic sedan made for Van Diesel to save his family.

And more importantly, despite Mustang's two best friends are all gone: Chevy announced they won't build a next gen Camaro and Dodge is making a "Last Call" to its enthusiasts, Mustang will keep galloping in next 10 years because this, the seventh generation Mustang is arrived, more gigantic, more villainous, more technological, more in every single way.

6

Still equipped with the 5-liter Coyote V8 engine, but Ford add another intake and made it more powerful and looks as vicious as a demon's head. Still equipped with a manual transmission, but this time manual gearbox will only appear on V8 models. That is surely a Ford's hint: Buy the V8 one please, because it is genuinely fabulous.

A V8 Mustang used to be floppy and thirsty and can not make a turn, however, after these years' adjustments, this new gen Mustang performs not that obtrusive in straight acceleration but surprisingly impressive in corners. Not good at being straight is normal nowadays, but how did Ford fit a muscle car with a good handling?

Well, Ford engineers give this car a proper limited-slip diff which really helps shuffle power across the rear axle and a new-developed MagneRide suspension so that the car would generate oodles of grip in the corners. Combined that robust naturally-aspirated V8, although it still could not handle mountain roads as good as those Porsches or BMs, it will be the most suitable car for roaring in a great canyon.

6

And this glorious new Mustang GT is not Ford's grand finale, it is just a new beginning of another great era: a more powerful Mustang model called Dark Horse is already be introduced, a 800 hp Mustang GTD will come out in next few years to challenge highest level european track weapon like 992 GT3 RS... This new era is just like the Late Cretaceous, despite it is the last period of those combustion-dinosaur Mustang, some T-Rex level species like Mustang GTD will stand out to defend Mustangs' dignity, to prove American muscle cars' indomitableness .

4

A110 (2017)

A French RWD sports car… That is just like saying you need a Russian visa to visit Alaska, it sounds like a thing belongs to a period in ages ago. But things become a bit different now, not about Russia, about this, the new Alpine A110 launched in 2017.

It is a two-seater little sports car equips a cute 1.8-liter turbocharged 4-cylinder engine which can generate 252 bhp, but the price is not cute, it costs €69k… Now for 2k euro less, you could get a mid-engine 718 Cayman with a bigger horsepower, more importantly, that is a Porsche, whereas this is Ah… pin what?

VERDICT:
SURPRISINGLY, FRENCH DID NOT FORGET HOW TO BUILD A RWD CAR.

4

So, it is a French tiny car with a small engine, and you also had to explain what it is and which wrong drug you took caused you to purchase one of these when your friends or family have seen the car. Seems like French successfully made another weird car that nobody would even give a toss… Again.

However, in fact, this car is on a roll in UK, EU and Japan. So what is the reason makes all tasteful car markets accept this car? For starters, let's talk about the Alpine.

Alpine is a historical brand founded by Jean Rédélé in 1955, in the first couple of years, Alpine's work is just using some Renault chassis and engines to create some self-designed coupé (A106 and A108) and it was quite success including some major events class wins, but soon after, they were not satisfied about just doing some work on those lame Renault platforms so that they began to develop their own chassis.

4

And many European memorized this brand till Alpine came out this, the stunning original Alpine A110 (1963), a little two-seater RR sports car model series staggeringly last 14 years and more importantly, it is the winner of IMC* 1971 and the first WRC after bought by Renault in 1973. Just savouring this title, “The First WRC Winning Car”… Jeez. As a result, the original A110 is literally one of the greatest car series French ever done. After A110, Alpine had came out some other sports cars like A310 and A610 but not quite impressive and the sales became disastrous, for instance, the A610, only 818 examples left the factory… And in 1995, Alpine brand was abandoned by Renault, but its factory still kept making some great Renault Sport models.

2000s is an epic era, a period for those iconic classics waking up, Mustang, Camaro, Challenger, GT-R… Countless models were brought back to the show. Renault also had the plan to revive their marque and the decision was confirmed in 2009. Then, our protagonist appeared, the A110 is back! Not only with the legendary badge, but also with a glamorous retro exterior and a delicacy mechanism.

*IMC: International Championship for Manufacturers, replaced by WRC in 1973

4

First, about the exterior, numerous details will reflect its great ancestor: the rally-style circle headlights, curve on the side, rear window glass… Then the mechanism, the original A110 is a devoted follower of minimalist principles, weighs only 706 kg, as a reason, Renault engineers shaved weights meticulously in every single place they could, for example, the chassis and body all made from aluminium, and the seats, stereo, nearly all interior bits were lightweighting designed. And the result is unexpectedly profound: the whole car only weighs 1103 kg, 300 kg lighter than its Porsche rival…

Suddenly, its small engine seems utterly reasonable, it attains a perfect balance with the feather-weight body, ensured the enjoyment in every corner, every sliding. And you would not feel miserable like sitting in a spartan Lotus at the same time, it has ABS, ESP, air-con, satnav, Bluetooth… Nearly anything you could find in a modern saloon.

So here we are, the brand new Alpine A110, a magnificent mid-engine no-nonsense sports car with glorious gene, combined its past and future. As we know, French invented the FWD car, as we also know, they could only build good FWD cars since they invent it. But this time, they proved their nature of making a fantastic RWD never fade. Hum, seems like this A110 is pretty valuable. For only two grand, you could switch from having a normal German female colleague to marrying a lovely adolescent princess from the purist French rally noble and indulging in the next-level riding experience… No, I got that wrong, uh… you know what I meant.
